23. Create function for printing an array and call it from main (Employee array)

store empid,name,sal, sort it on salary and display in sorted order of sal

ask user whether to sort in ascending or descending order and do accordingly.

27. Create Student class and add rollNo and name in it. Create Accept() function which will take an array of Students as input, but add only one object at a time in the array.(hint: maintain count) Write one more function to display student data. This Display() function should receive Student array.

28. create following classes using Inheritance

and test whether you can create objects of all classes,

and also check whether you can call functions of the classes

Design a system for XYZ Bank for storing account details,

Every account will have type either saving account or current account or demat account

For every account interest rate and minimum balance need to be stored.

Interest rate for saving account is 4% and for current account 1%

Minimum balance for saving account will be 20000 and current account will be 1000

For each account store account holder details(fname, lname, mobile, email)

If it's a saving account, then store chequebooknumber

If current account then store number of transactions/day, number of transactions will be different for every account based on average annual balance in the account and will keep on changing based on how customer maintains the balance in the account.

For demat account store share details, for every share store name, number of shares buying price, date of purchase, selling price, date of selling.
